Additional file 5: Figure S4

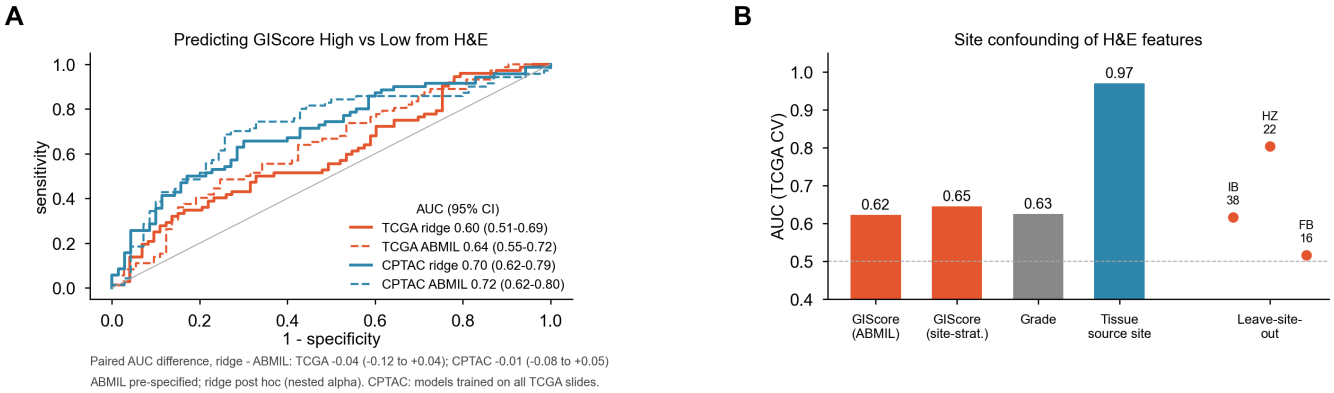

Figure S4. RNA-score-group classification and site confounding. (A) H&E predictions of within-cohort GIScore-high versus -low labels in TCGA and CPTAC-PDA. ABMIL was prespecified; ridge regression was a post hoc comparator. Models were fitted to TCGA for CPTAC transfer. AUC intervals and paired ridge-minus-ABMIL AUC intervals use the archived paired bootstrap. These ROC curves classify RNA-derived groups, not survival. (B) Internal-CV classification of GIScore group, grade and tissue source site, plus leave-one-site-out GIScore results. Site information was strongly encoded; external classification does not establish replication of the C1 regression association. External ABMIL seed timing limits exact retraining reproducibility.
